

SEE AND FEEL THE CONNECTIONS!

THE SYMBA™ RIB CAGE IS DESIGNED FOR TACTILE DEMONSTRATION OF HOW THE SPINE AND RIBS ARE ONE CONNECTED SYSTEM.

This hemi-functional articulated model lets your clients see and feel how triplanar movements and patterned asymmetries affect balance in the body. The synchronized movement of the respiratory and pelvic diaphragm during breathing, combined with the recognition of our system's bilateral asymmetry, are keys to understanding proper assessment of spinal and postural disorders.

* SYMBA: Synchronized Movement Bilateral Asymmetry

Healthcare Professionals Benefit from Anatomical Models that are Tactile, Moveable, Pliable and Flexible.

Our models make it easy for clients to fully grasp how their bodies interoperate functionally and connect interdependently so they can better visualize cause and effect.

Sawbones makes a rich line of simulation and demonstration products to assist Patient-Doctor relationships. Our hands-on, visual products aid in the effective communication and understanding of the afflicting condition as well as the proposed treatment. They bring patients better understanding which helps improve outcomes.

Twisting the model clearly shows the interconnected system so patients can see, experience and feel the movement and patterned positions throughout the ribcage and spine.

WITH HEALTHCARE PROFESSIONALS AND
ENTREPRENEURIAL COMPANIES to create custom models and solutions that seek to revolutionize the patient education and training market.
